

Setup Guide: Mapping Customers to **AWS accounts**

Introduction

After you have added your customers in CloudBilling, you need to map them to the accounts delivered by AWS.

Note: this step can only be taken after CloudBilling has retrieved its first update from AWS, after you have completed the [setup](#).

Mapping Customers to AWS accounts

1. Login to your [CloudBilling environment](#).
2. In the top menu, hover your mouse over 'Connectors' and click on 'Amazon Web Services'. The 'Amazon Web Services – Customer Mapping' tab opens.
3. In the right column you see all the Amazon accounts (master and linked) that the Connector has retrieved. Find the account(s) you want to map to a Customer.
4. In the left column, fold out the drop-down menu and click on customer you have created earlier.
5. Click on 'Approve'
6. Repeat these steps until you have mapped all the tenants to the CloudBilling Customers

Note: you can only approve a single mapping at a time.

Note: it is possible to map multiple accounts to a single CloudBilling Customer.

After consent has been provided and your customers have been added and mapped, it requires another run of the CloudBilling AWS Connector to retrieve the AWS resource usage for your customers.

The CloudBilling AWS Connector runs automatically every day at 07:00 PM CET.
